

# Python Summary

The textbook has many useful tables describing various functions and what they do. Here I have tried to bring everything together so that you can have it as an easy reference. While I have included everything that was in the tables in the book, I have rearranged some parts to avoid duplication and added some extra commands where I thought they may be useful.

## Contents

1	Common Syntax . . . . .	1
2	Built-in Functions . . . . .	2
3	Common Libraries . . . . .	2
4	Portable Graphics Library . . . . .	3
5	String Methods . . . . .	6
6	List Methods . . . . .	7

## 1 Common Syntax

### If statements

```
if condition:  
    statements
```

```
if condition:  
    statements  
else:  
    statements
```

```
if condition1:  
    statements  
elif condition2:  
    statements  
elif condition3:  
    statements  
else:  
    statements
```

### Loop statements

#### While statements:

```
while condition:  
    statements
```

#### For statements:

```
for var in seq:  
    statements
```

```
for var in range(limit):  
    statements
```

### Other statements

#### Function definition

```
def name(parameters):  
    statements
```

#### Return statement

```
return value
```

## 2 Built-in Functions

### Built-in Python Functions

#### Built-in functions

<b>abs</b> ( <i>x</i> )	Returns the absolute value of <i>x</i> .
<b>max</b> ( <i>x</i> , <i>y</i> , ...)	Returns the largest of the arguments.
<b>min</b> ( <i>x</i> , <i>y</i> , ...)	Returns the smallest of the arguments.
<b>round</b> ( <i>x</i> )	Returns the closest integer to <i>x</i> .
<b>int</b> ( <i>x</i> )	Converts <i>x</i> to an integer.
<b>float</b> ( <i>x</i> )	Converts <i>x</i> to a floating-point number.
<b>len</b> ( <i>s</i> )	Returns the length of the string argument <i>s</i> .
<b>str</b> ( <i>x</i> )	Converts <i>x</i> to a string.
<b>str</b> ( <i>value</i> )	Converts <i>x</i> to a string.

## 3 Common Libraries

### Selections from the math library

#### Mathematical constants

<b>pi</b>	The mathematical constant $\pi$ .
<b>e</b>	The mathematical constant <i>e</i> (the base for natural logarithm).

#### General mathematical functions

<b>sqrt</b> ( <i>x</i> )	Returns the square root of <i>x</i> .
<b>floor</b> ( <i>x</i> )	Returns the largest integer less than or equal to <i>x</i> .
<b>ceil</b> ( <i>x</i> )	Returns the smallest integer greater than or equal to <i>x</i> .
<b>copysign</b> ( <i>x</i> , <i>y</i> )	Returns <i>x</i> with the sign of <i>y</i> .

#### Logarithmic and exponential functions

<b>exp</b> ( <i>x</i> )	Returns the exponential function of <i>x</i> ( $e^x$ ).
<b>log</b> ( <i>x</i> )	Returns the natural logarithm (base <i>e</i> ) of <i>x</i> .
<b>log10</b> ( <i>x</i> )	Returns the common logarithm (base 10) of <i>x</i> .

#### Trigonometric functions

<b>cos</b> ( <i>theta</i> )	Returns the cosine of the radian angle <i>theta</i> .
<b>sin</b> ( <i>theta</i> )	Returns the sine of the radian angle <i>theta</i> .
<b>tan</b> ( <i>theta</i> )	Returns the tangent of the radian angle <i>theta</i> .
<b>atan</b> ( <i>x</i> )	Returns the principal arctangent of <i>x</i> , which lies between $-\pi/2$ and $+\pi/2$ .
<b>atan2</b> ( <i>y</i> , <i>x</i> )	Returns the angle between the <i>x</i> -axis and the line from the origin to ( <i>x</i> , <i>y</i> ).
<b>radians</b> ( <i>angle</i> )	Converts an angle measured in degrees to radians.
<b>degrees</b> ( <i>angle</i> )	Converts an angle measured in radians to degrees.

## Selections from the random library

### Random integers

<b>randint</b> ( <i>min</i> , <i>max</i> )	Returns a random integer between <i>min</i> and <i>max</i> , inclusive.
<b>randrange</b> ( <i>limit</i> )	Returns a random integer from 0 up to but not including <i>limit</i> .
<b>randrange</b> ( <i>start</i> , <i>limit</i> )	Returns a random integer from <i>start</i> up to but not including <i>limit</i> .

### Random floating-point numbers

<b>random</b> ()	Returns a random floating-point number in the range between 0 and 1.
<b>uniform</b> ( <i>min</i> , <i>max</i> )	Returns a random floating-point number between <i>min</i> and <i>max</i> .

### Random functions on lists

<b>choice</b> ( <i>list</i> )	Returns a random element from the specified list.
<b>sample</b> ( <i>list</i> , <i>k</i> )	Returns a list with <i>k</i> elements randomly chosen from <i>list</i> .
<b>shuffle</b> ( <i>list</i> )	Rearranges the list in a random order.

### Initialization functions

<b>seed</b> ()	Randomizes the internal number generator.
<b>seed</b> ( <i>k</i> )	Sets the internal state of the random number generator so that it generates the same sequence for any specific value of the integer <i>k</i> .

## 4 Portable Graphics Library

### Methods for GWindow objects

<b>GWindow</b> ( <i>width</i> , <i>height</i> )	Creates a new GWindow objects of the specified size.
<b>gw.get_width</b> ()	Returns the width of the graphics window.
<b>gw.get_height</b> ()	Returns the height of the graphics window.
<b>gw.add</b> ( <i>obj</i> )	Adds the object to the graphics window.
<b>gw.add</b> ( <i>obj</i> , <i>x</i> , <i>y</i> )	Repositions the object to ( <i>x</i> , <i>y</i> ) and adds it to the window.
<b>gw.remove</b> ( <i>obj</i> )	Removes the object from the graphics window.
<b>gw.clear</b> ()	Removes all objects from the graphics window.
<b>gw.get_element_at</b> ( <i>x</i> , <i>y</i> )	Returns the topmost graphical object covering the point ( <i>x</i> , <i>y</i> ). If no such object exists then <b>None</b> is returned.
<b>gw.add_event_listener</b> ( <i>type</i> , <i>func</i> )	Prepares the window to respond to events of the specified <i>type</i> by calling <i>func</i> .
<b>gw.set_interval</b> ( <i>func</i> , <i>delay</i> )	Prepares the window to <u>repeatedly</u> call <i>func</i> every <i>delay</i> milliseconds.
<b>gw.set_timeout</b> ( <i>func</i> , <i>delay</i> )	Prepares the window to call <i>func</i> <u>once</u> after waiting <i>delay</i> milliseconds.

## Creating Graphical Objects

### Creating graphical objects

<b>GRect</b> ( <i>x, y, width, height</i> )	Creates a <b>GRect</b> object with the specified dimensions.
<b>GRect</b> ( <i>width, height</i> )	Creates a <b>GRect</b> object an (0,0) with the specified size.
<b>G Oval</b> ( <i>x, y, width, height</i> )	Creates a <b>G Oval</b> object that fits inside the corresponding rectangle of the specified size.
<b>G Oval</b> ( <i>width, height</i> )	Creates a <b>G Oval</b> object in which the oval ifts inside a rectangle of the specified size. The origin of the <b>G Oval</b> is at (0,0).
<b>GLine</b> ( <i>x<sub>1</sub>, y<sub>1</sub>, x<sub>2</sub>, y<sub>2</sub></i> )	Creates a <b>GLine</b> object connection ( <i>x<sub>1</sub>, y<sub>1</sub></i> ) and ( <i>x<sub>2</sub>, y<sub>2</sub></i> ).
<b>GLabel</b> ( <i>str, x, y</i> )	Creates a <b>GLabel</b> object containing the specified string with its baseline origin at the point ( <i>x, y</i> ).
<b>GLabel</b> ( <i>str</i> )	Creates a <b>GLabel</b> object containing the specified string with its baseline origin at the point (0,0).
<b>GArc</b> ( <i>x, y, width, height, start, sweep</i> )	Creates a <b>GArc</b> object at the specified point and dimensions which starts at <i>start</i> degrees and extends counterclockwise <i>sweep</i> degrees.
<b>GPolygon</b> ()	Creates an empty <b>GPolygon</b> object, which then needs vertices to be added.
<b>GCompound</b> ()	Creates an empty <b>GCompound</b> object, into which other objects can then be added.

## Methods available to all objects

### Methods that control the location

<i>object.set_location</i> ( <i>x, y</i> )	Sets the location of this object to ( <i>x, y</i> ).
<i>object.move</i> ( <i>dx, dy</i> )	Moves the object using the displacements <i>dx</i> and <i>dy</i> .
<i>object.move_polar</i> ( <i>r, theta</i> )	Moves the object <i>r</i> pixels in the direction <i>theta</i> .

### Methods that control the appearance

<i>object.set_color</i> ( <i>color</i> )	Sets the color used to display this object.
<i>object.set_line_width</i> ( <i>width</i> )	Sets the width of the lines (in pixels) used to draw the object.
<i>object.set_visible</i> ( <i>flag</i> )	Sets whether the object is visible, where <i>flag</i> is a boolean.
<i>object.rotate</i> ( <i>theta</i> )	Rotates the object <i>theta</i> degrees about its origin.
<i>object.scale</i> ( <i>sf</i> )	Scales the object by <i>sf</i> both horizontally and vertically.

### Methods that control the stacking order

<i>object.send_backward</i> ()	Moves this object one step backward in the stacking order.
<i>object.send_forward</i> ()	Moves this object one step forward in the stacking order.
<i>object.send_to_back</i> ()	Moves this object to the back of the stacking order.
<i>object.send_to_front</i> ()	Moves this object to the front of the stacking order.

### Methods that return properties

<i>object.get_x</i> ()	Returns the <i>x</i> coordinate of the object.
<i>object.get_y</i> ()	Returns the <i>y</i> coordinate of the object.
<i>object.get_width</i> ()	Returns the width of the object.
<i>object.get_height</i> ()	Returns the height of the object.
<i>object.get_color</i> ()	Returns the color used to display this object.
<i>object.get_line_width</i> ()	Returns the width of the lines used to draw the object.
<i>object.is_visible</i> ()	Returns a boolean indicating whether the object is currently visible.
<i>object.contains</i> ( <i>x, y</i> )	Check to see whether the point ( <i>x, y</i> ) is inside the object.

## Methods only available to GFillableObject objects

GFillableObjects include GRects, GObvals, GArcs, and GPolygons

<code>object.set_filled(bool)</code>	Sets whether the object is filled.
<code>object.set_fill_color(color)</code>	Sets the color used to fill the interior of the object.
<code>object.get_fill_color()</code>	Returns the color used to display the interior of the object.
<code>object.is_filled()</code>	Returns a boolean indicating whether the object is currently filled.

## Methods only available to GLabel objects

<code>object.set_font(str)</code>	Sets the font for the label. The format of the font specification is a CSS string as described in the text.
<code>object.set_label(str)</code>	Sets the text of the label to the provided string.
<code>object.get_label()</code>	Returns the text of the label as a string.
<code>object.get_ascent()</code>	Returns the <i>font ascent</i> (the maximum distance above the baseline).
<code>object.get_descent()</code>	Returns the <i>font descent</i> (the maximum distance below the baseline).

## Methods only available to GLine objects

<code>object.set_start_point(x, y)</code>	Changes the starting point of the line to $(x, y)$ without changing the end.
<code>object.set_end_point(x, y)</code>	Changes the end point of the line to $(x, y)$ without changing the start.
<code>object.get_start_point()</code>	Returns the starting point of the line.
<code>object.get_end_point()</code>	Returns the end point of the line.

## Methods only available to GRect or GObval objects

<code>object.set_size(width, height)</code>	Sets the size of the object to the specified width and height.
<code>object.set_bounds(x, y, width, height)</code>	Sets both the location of the object and the size of the object.

## Methods only available to GArc objects

<code>arc.set_start_angle(start)</code>	Sets the start angle to <i>start</i> degrees.
<code>arc.get_start_angle()</code>	Returns the start angle.
<code>arc.set_sweep_angle(sweep)</code>	Sets the sweep angle to <i>sweep</i> .
<code>arc.get_sweep_angle()</code>	Returns the sweep angle.
<code>arc.get_start_point()</code>	Returns the coordinate of the starting point of the arc.
<code>arc.get_end_point()</code>	Returns the coordinate of the ending point of the arc.

## Methods only available to GPolygon objects

<code>poly.add_vertex(x, y)</code>	Adds a vertex at the point $(x, y)$ .
<code>poly.add_edge(dx, dy)</code>	Adds a vertex shifted by <i>dx</i> and <i>dy</i> from the preceeding vertex.
<code>poly.add_polar_edge(r, theta)</code>	Adds a vertex shifted by <i>r</i> units in direction <i>theta</i> .
<code>poly.get_bounds()</code>	Returns a GRect object of the bounding rectangle of the polygon.

## 5 String Methods

### Common methods in Python's string class

#### Finding patterns

<code>str.find(pattern)</code>	Searches the string <i>str</i> for the string <i>pattern</i> , starting at the beginning of <i>str</i> . Returns the first index at which the pattern appears, or <code>-1</code> if not found.
<code>str.find(pattern, k)</code>	Same as above, but starts the search at index <i>k</i> .
<code>str.rfind(pattern)</code>	Searches backward in <i>str</i> for the last instance of <i>pattern</i> , starting at the end of <i>str</i> . Returns the last index at which the pattern appears, or <code>-1</code> if not found.
<code>str.rfind(pattern, k)</code>	Same as above, but starts at index <i>k</i> .
<code>str.startswith(prefix)</code>	Returns <code>True</code> if <i>str</i> starts with the characters in <i>prefix</i> .
<code>str.endswith(suffix)</code>	Returns <code>True</code> if <i>str</i> ends with the characters in <i>suffix</i> .

#### Creating transformed strings

<code>str.lower()</code>	Returns a copy of <i>str</i> with all letters converted to lowercase.
<code>str.upper()</code>	Returns a copy of <i>str</i> with all letters converted to uppercase.
<code>str.capitalize()</code>	Returns a lowercase copy of <i>str</i> but with the first letter capitalized.
<code>str.lstrip()</code>	Returns a copy of <i>str</i> after removing any whitespace characters from the left side.
<code>str.rstrip()</code>	Returns a copy of <i>str</i> after removing any whitespace characters from the right side.
<code>str.strip()</code>	Returns a copy of <i>str</i> after removing any whitespace characters from both sides.
<code>str.replace(old, new)</code>	Returns a copy of <i>str</i> after replacing all instances of the string <i>old</i> with the string <i>new</i> .

#### Testing for character properties

<code>str.isalpha()</code>	Returns <code>True</code> if <i>str</i> is nonempty and contains only letters.
<code>str.isdigit()</code>	Returns <code>True</code> if <i>str</i> is nonempty and contains only numeric digits.
<code>str.isalnum()</code>	Returns <code>True</code> if <i>str</i> is nonempty and contains only letters or digits.
<code>str.islower()</code>	Returns <code>True</code> if <i>str</i> has at least one letter and all letters are lowercase.
<code>str.isupper()</code>	Returns <code>True</code> if <i>str</i> has at least one letter and all letters are uppercase.
<code>str.isspace()</code>	Returns <code>True</code> if <i>str</i> is nonempty and contains only whitespace characters (eg. space, tab, or newline).

#### Formatting strings

<code>str.center(width)</code>	Returns a copy of <i>str</i> centered in a field of the specified <i>width</i> .
<code>str.ljust(width)</code>	Returns a copy of <i>str</i> flush to the left in a field of the specified <i>width</i> .
<code>str.rjust(width)</code>	Returns a copy of <i>str</i> flush to the right in a field of the specified <i>width</i> .
<code>str.format(...)</code>	Returns a copy of <i>str</i> after inserting formatted values.

## Format Spec components

Symbol that you want to fill any empty space. By default it is the space character.

<, >, or ^ symbols controlling how the string is justified in the available width.

Grouping symbol (,) if desired. Defaults to none.

Controls desired number of digits after decimal. Has the form .*number*

[fill] [align] [sign] [width] [group] [precision] [type]

Digit representing the *minimum* number of characters the representation will occupy.

Including a + symbol will force always showing the sign of a number. (whether positive or negative)

Controls how the substitute value is represented:

- d: base-10 integers
- f: floating-point decimals
- e: scientific notation
- s: strings
- b: binary
- x: hexadecimal

## 6 List Methods

### Common methods in Python's list class

#### Methods that leave the original list unchanged

<code>list.index(value)</code>	Returns the first index matching <i>value</i> . This method raises a <code>ValueError</code> exception if no match is found.
<code>list.index(value, start)</code>	Starting from <i>start</i> , returns the first index matching <i>value</i> . This method raises a <code>ValueError</code> exception if no match is found.
<code>list.count(value)</code>	Returns the number of times that <i>value</i> appears in the list.
<code>list.copy()</code>	Returns a <i>shallow</i> copy of the original list.

#### Methods that add or remove elements

<code>list.append(value)</code>	Adds <i>value</i> to the end of the list.
<code>list.extend(list<sub>2</sub>)</code>	Adds the elements in <i>list<sub>2</sub></i> to the end of the list.
<code>list.insert(index, value)</code>	Inserts <i>value</i> before the specified <i>index</i> position.
<code>list.remove(value)</code>	Removes the first instance of <i>value</i> from the list, raising a <code>ValueError</code> exception if it does not appear.
<code>list.pop()</code>	Removes and returns the last element of the list.
<code>list.pop(index)</code>	Removes and returns the element at the specified <i>index</i> position.
<code>list.clear()</code>	Removes all elements from a list.

#### Methods that reorder the elements of a list

<code>list.reverse()</code>	Reverses the order of the elements in the list.
<code>list.sort()</code>	Sort the elements of the list in ascending order.
<code>list.sort(key)</code>	Sort the elements of the list in ascending order according to a particular <i>key</i> .
<code>list.sort(key, reverse=True)</code>	Sort the elements of the list in descending order according to a particular <i>key</i> .
