#### Review Question!

Location A lies within a neutral, solid piece of metal which has been placed near two point charges. Which diagram to the right shows the proper Electric field vectors due to:

- Charge  $q_1$
- Charge  $q_2$
- The surface charge on the metal

#### What we'd like to understand:

- How do objects interact or behave near the generator?
- Why can we not neutralize the generator?
- How does a Van-der-Graff generator work?
- What happens when a spark jumps through air?

Two metal boxes with equal dimensions are sitting next to one another but not touching.  $6\,\mu\text{C}$  of charge is placed onto one box. The boxes are then moved so they are touching, and then separated again. How much charge is on each box?

Now say three metal boxes with equal dimensions are sitting next to one another but not touching.  $6\,\mu\text{C}$  of charge is placed onto one box. The boxes are then moved so they are touching, and then separated again. How much charge is on each box?

Two metal boxes with equal dimensions are sitting next to one another but not touching. The boxes are then moved so they are touching, and then a 10 mC charge is brought near the left box but does *not* touch it. The boxes are separated, and then the charge is removed. What is the net charge on each box?

#### **Understanding Check**

Consider the sequence of events to the right. Both blocks are neutral conductors initially. What is the net charge on block A at the conclusion?

- A. Positive
- B. Negative
- C. Neutral
- D. None of the above

- We know the electric field due to a point charge
- We know that superposition holds for multiple charges
- Want to use that to build up electric field from charge distributions
- The plan of attack:
  - A. Break our distribution up into pieces
  - B. Determine the E-field due to one piece
  - C. Add up the contributions from all the pieces
  - D. Check to make sure we haven't messed up royally

Say we have a uniformly charged thin rod. We'd like to determine an expression for the electric field near that rod.

• We note that it is rotationally symmetric

Say we have a uniformly charged thin rod. We'd like to determine an expression for the electric field near that rod.

- We note that it is rotationally symmetric
- We slice up the rod into smaller chunks

Now to determine the electric field due to our  $\Delta Q$ :

• Determine  $\vec{\mathbf{r}}$ :

$$\vec{\mathbf{r}} = \langle x, -y, 0 \rangle$$

• Find the magnitude and r:

$$|\vec{\mathbf{r}}| = \sqrt{x^2 + y^2}, \quad \hat{\mathbf{r}} = \frac{\langle x, -y, 0 \rangle}{\sqrt{x^2 + y^2}}$$

Write out the F-field:

$$\Delta \vec{\mathbf{E}} = \frac{1}{4\pi\epsilon_0} \frac{\Delta Q}{\sqrt{x^2 + y^2}} \frac{\langle x, -y, 0 \rangle}{\sqrt{x^2 + y^2}}$$

Line 'em up! February 7, 2020 Jed Rembold 10 / 12

Can break into components:

$$\Delta E_x = \frac{1}{4\pi\epsilon_0} \frac{x\Delta Q}{\left(x^2 + y^2\right)^{3/2}}$$
$$\Delta E_y = \frac{1}{4\pi\epsilon_0} \frac{-y\Delta Q}{\left(x^2 + y^2\right)^{3/2}}$$

- To get total electric fields (not  $\Delta$ ), we need to sum over the different segments (superposition ftw!)
- Can be useful to write:

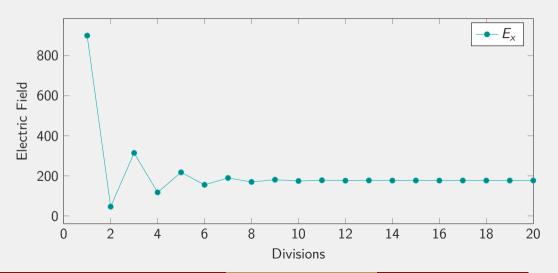

$$\frac{\Delta Q}{\Delta v} = \frac{Q}{I} \quad \Rightarrow \quad \Delta Q = \frac{\Delta y}{I} Q$$

у	$\Delta E_{x}$	$\Delta E_y$
-0.45	0.92	4.13
-0.35	1.87	6.53
-0.25	4.61	11.53
-0.15	15.36	23.04
-0.05	64.4	32.2
0.05	64.4	-32.2
0.15	15.36	-23.04
0.25	4.61	-11.53
0.35	1.87	-6.53
0.45	0.92	-4.13
